<p><i>Microbiological evaluation of the lime and phosphate requirement of the soil.</i> <i>A. P. KRYVOMENYI, Trans. Sci. Inst. Fertilizers (Moscow) No. 78, 14-49(1930).—</i> <i>By adding various amts. of soil phosphates at rates varying from 45 to 540 kg. per hectare to soils prepd. by the Vinogradskii method in Petri dishes in which artificial inoculation of definite numbers of <i>Aspergillus</i> was made, it was found possible from the counts made after 24 and 48 hrs. to det. the P₂O₅ requirement of the soil. By a similar procedure the lime requirement was detd. With peated soils the inoculation of the plates produces butyric acid, which obscures the results. To overcome this the soils were sterilized and only then subjected to the Vinogradskii test. It was also found possible to avoid the butyric acid fermentation by draining the plates through a layer of charcoal added at the bottom of the plate and connecting the plate with the open by means of a tube. With this precaution it was not necessary to sterilize the soil.</i> <i>J. S. Jones</i></p>

PROCEDURE AND PROPERTIES INDEX

Microbiological evaluation of fertilizers A. P. Kryachkova. *Microbiology* (U. S. S. R.) 6, 304-30 (1937); *Chem. Zentr.* 1937, II, 2888; cf. *C. A.* 29, 1559. — The previously described method of soil plate cultures with *Azotobacter* was used for evaluating fertilizers. An amt. of fertilizer, calc'd. as P_2O_5 , was introduced immediately into the soil on the surface of which *Azotobacter* developed. The method can be used for detg. the assimilability of P_2O_5 ; expts. with higher plants substantiated the results. The microbiol. method can be applied to the solution of such questions as the following: the limiting value of P_2O_5 for increasing the assimilability; the effect of admixts. on the plants; the influence of the method of prepn. of phosphoric or apatite on the assimilability of the P_2O_5 . In contrast to chem. analysis, *Azotobacter* gives a complete evaluation of the fertilizer, based on the combined action of P_2O_5 , CaO and SiO_2 . Microbiol. characteristics are given of phosphate fertilizers, including thermophosphates and thermophosphate slags, i. e., products of the fusion of apatite-nephelite minerals with metallurgical slags or fertilizers obtained by the sintering of apatite-nephelite minerals with dolomite. The results correspond with those obtained in expts. with higher plants on sand and soil cultures. M. G. Moore

CH ✓ Greater utilization of xylose and arabinose in fermentation processes. A. P. Kiyuchikova, and G. S. Rodionova. *Gidroliz. i Leishim. Prom. S.* No. 4, 11-13(1955).--To enhance the fermentation of xylose and arabinose sugars plant expts. have been carried out with various strains of *Candida*, *Zygosporpora*, *Torulopsis*, and *Trichosporra*. Many strains have shown high activity and have given good yields. It was noticed that yeasts building micellar structure during the fermentation (some strains of *Zygosporpora* and *Candida*) gave poorer yields. Sporogenous *Candida* gave the lowest results. Fermentation activity was greatly intensified also by adding certain strains of *Zygosporpora* and *Candida* to the same batch.

TITLE: Continuous Fermentation and Breeding of Microorganisms
(Kontinuyuyemye vrascheniye i vyrazhivaniye mikroorganizmov)

PERIODICAL: Vestnik Akademii nauk SSSR, 1957, Nr 2, pp 106-108 (USSR)

ABSTRACT: The Institute microbiologii Akademii nauk SSSR (Microbiological Institute of the Academy of Sciences, USSR) convened a conference from October 13 to 15, 1956 which dealt with the investigation of some working results in this field as well as with the discussion of a further intensification of the production basing on the activity of microorganisms. The conference was attended by more than 700 representatives of academic and scientific branch research institutes, enterprises, organizations, universities, as well as foreign scientists. The following lectures were heard:
N. B. Iyeronimovich spoke of the theoretical foundation of the method of continuous microbe breeding and its prospects of application in the microbiological industry.
Ye. A. Plovak, Vsesoyuznyy nauchno-issledovatel'skiy institut khlebopekarnoy promyshlennosti (All-Union Scientific Research Institute of Bread-Production Industry) dealt with the problem of the breeding of yeast in solutions containing molasses.
P. M. Fisher, K. P. Andrasov, V. A. Stankova, M. Ye. Kaluzhnyy and A. P. Krushkova, Vsesoyuznyy nauchno-issledovatel'skiy institut gidroliznyy i kul'tivatsionno-spirtovoy promyshlennosti (All-Union Scientific Research Institute for the Industry of Hydrolysis and Sulfitic Spirits) evaluated the theoretical and practical work in the field of continuous fermentation of wood hydrolysates and sulfitic liquor as well as their utilization for obtaining fodder yeast.
Y. L. Mamanova, Krasnoyarskiy gidroliznyy zavod (Krasnoyarsk Hydrolysis Plant) said that the introduction and completion of the continuous process of yeast breeding made it possible to increase the output of yeast factories by ten times.
V. L. Yarmoshko, A. L. Malchuk, Vsesoyuznyy nauchno-issledovatel'skiy institut spirtovoy i likernoy promyshlennosti (All-Union Scientific Research Institute of the Spirit, Liqueur and Brandy Industry), V. M. Makhomovich, Dzhukhominetskiy nauchno-issledovatel'skiy laboratoriy (Dzhukhominetskiy Scientific Research Laboratory) reported on the experiment of applying the method of continuous fermentation

Card 1/4

Card 2/4

Continuous Fermentation and Breeding of Microorganisms SOV/GO-53-2-10/60

of the starchy raw material and syrup in the alcohol and acetone-butanol industry.

S. A. Kamyshov, All-Union Scientific Research Institute of the Alcohol, Liqueur and Brandy Industry reported on the problem of antiseptics in fighting infection due to ferment.

L. Yu. Madzinskaya, Institut mikrobiologii Akademii nauk USSR (Microbiological Institute of the AS USSR) reported on the investigation of the morphological and physiological properties of yeast.

A. B. Kazalanka, Andrushevskiy spirtovy zavod (Andrushevskiy Distillery), N. Ya. Baryshko, Kalo-Viskovskiy spirtovy zavod (Kalo-Viskovskiy Alcohol-Distillery), M. A. Makarova, Smolenskiy Sovnarzhoz (Smolensk Sovnarzhoz) reported on some working results obtained by distilleries in the syrup fermentation by using the method of continuous flow.

N. S. Leytynskiy, Leningradskiy universitet (Leningrad University) characterized the correlation of reproduction processes and biochemical activity of acetic acid bacteria in the high-speed production of vinegar.

S. M. Perenova, Microbiological Institute of the AS USSR spoke of the possibility of obtaining vitamin B₁₂ by continuous breeding of propionic acid bacteria (propionovokislitsy bakterii). S. L. Brinberg, G. L. Grubovskaya, Vsesoyuzny nauchno-issledovatel'skiy institut antibiotikov (All-Union Scientific Research Institute of Antibiotics) reported on the application of this method in the production of penicillin.

V. V. Kuzhik, All-Union Scientific Research Institute of the Spirit, Liqueur, and Brandy Industry showed that the method of semi-continuous breeding of the fungus *Aspergillus niger* accelerates fermentation. B. V. Perfil'yev, Leningrad University reported on the results of investigations of the natural microflora by the method of capillary microscopy which he had developed.

V. A. Kamyshov, Rязan' University demonstrated his new batcher for continuous breeding of microorganisms in laboratory practice.

J. Vlatk and J. Sidor (Czechoslovakia) expressed their opinions on the methods of continuous breeding of microorganisms.

On this Conference it was pointed to the necessity of organizing the industrial production of cultures for continuous fermentation.

Amylase and lipase as indexes of changes in the functional condition of the pancreas during the course of ontogenesis. A. P. Knyuchkovy, J. Physiol. (U. S. S. R.) 27, 437-44 (in English, 444) (1936).—The pancreatic juice of dogs 0-12 days of age contains very small amts. of amylase (I) and no lipase (II). The amt. of I begins to increase slowly on the 18th-14th day after birth, and II makes its appearance. At the age of 1.5 months the values for I and II rise rapidly to values characteristic of adult animals. The intestinal juice of 1-day-old dogs already has the capacity of activating I. The symogen of II present up to the age of 12 days can be activated by bile, intestinal juice or gastric juice, but the chief means of splitting fats is considered to be the lipase ingested with the milk of the mother. The changes in the properties of pancreatic juice at the age of 12-14 days coincide with the beginning of functional control over the pancreas of the vagus nerve, while the marked change at 1.5 months corresponds to the change from suckling to the usual mode of feeding.

ca		The role of the sympathetic nervous system in the regulation of the functional condition of the salivary gland in the course of ontogenesis. A. E. Koryuchkova. <i>J. Physiol.</i> U. S. S. R. 29, 47-51 (in English, 54) (1940). - In pup- ies stimulation of the peripheral end of the sym- pathicus resulted in qualitative alteration of the saliva. The secretion of the latter was induced by stimulation of the tympanic cord. The content of org. matter increased considerably above that of normal saliva, and ptyalin appeared, although normally it is absent in very young puppies. That these changes were due to the stimulation of the sympathicus was evident from the fact that upon excision of the upper cervical sympathicus ganglion the changes disappeared completely. 11 references.  : Second scientific conference on questions of age morphology and physiology.

Periodical : Zhur. vys. nerv. deyat. 5, 137-143, Jan/Feb 1955

Abstract : The second scientific conference on age morphology and physiology, sponsored by the Scientific Research Institute of Physical Education and Educational Hygiene, Academy of pedagogical sciences RSFSR, was held February 9-12, 1955. There was considerable interest in the results of studies showing the peculiarities of changes in higher nervous activity in children and animals during various stages of their growth.

Title : On the Individual and Age Particularities of the Nervous Activity in Children During the First Year of Life.

Orig Pub: Zh. vyssh. nervn. deyat-sti, 1957, 7, No 1, 63-74.

Abstract: The blinking and motor-alimentary conditioned reflexes upon sound stimuli were elaborated with difficulty and lacked stability during the first 3-4 months of life. Weakness of the processes of excitation and inhibition was noted. During the second half year, the reflexes were formed more rapidly and were of greater stability. The intensity of nervous processes increased, individual

TITLE: Thermal stability of B-trichloroborazole ^{2, 4, 55}

SOURCE: Zhurnal neorganicheskoy khimii, v. 10, no. 9, 1965, 2115-2119

TOPIC TAGS: organoboron compound, thermal stability, IR spectrum, thermogram, condensation reaction, thermal decomposition

ABSTRACT: The behavior of B-trichloroborazole at various temperatures was studied thermographically by recording the differential and gravimetric curves and by means of IR spectra. It was found that a slight decomposition of the compound with the evolution of hydrogen chloride occurs even at room temperature. The process is accelerated as the temperature rises. Thus, at 20C, 1.3% of the compound decomposes in one month and 2.6% in three months, whereas at 100C 2.7% decomposes in 3 hr and at 150C 40% decomposes in 3 hr. The main reaction products are those resulting from the condensation of B-trichloroborazole. In the solvent chlorobenzene, the condensation of B-trichloroborazole is less extensive than in the solid state without the solvent. Orig. art. has: 3 figures, 1 table, and 2 formulas.

 TITLE: Method for obtaining film-forming materials and impregnating materials for
 trimming and filling of natural and artificial leather. Class 39, No. 175227/5
 SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 70
 TOPIC TAGS: leather, polymer, protein, vinyl plastic, acrylic plastic
 ABSTRACT: This Author Certificate presents a method for obtaining film-forming and
 impregnating materials for trimming and filling of natural and artificial leather by
 modification of vinyl, for instance, acrylic and methacrylic monomers by means of
 proteins. To increase the thermal, acetone, and water stability of coatings and the
 durability and filling of the material structure, the starting monomers are
 emulsified in an aqueous protein solution. The emulsification is followed by

Title : The Importance of Replacing Blood Losses as Prevention of Disturbances of Cortex Activity.

Orig Pub : Uch. zap. Stavropol'sk. med. in-ta, 1957, vyp. 1, 109-115.

Abstract : Three dogs with preliminarily created functional stereotypes were subjected to a 50 percent blood loss. Later, the blood was replaced by a substitute consisting of a physiological solution or of ferrofucin (the following compounds were added to the physiological solution: glucose, sodium salycilate, colloid iron, gelatin, NaCl, and NaHCO₃). After bloodletting, hypochromic regenerative anemia was

observed for a period of 3 weeks. After the physiological solution was infused, conditioned reflexes (CR) in response to light and metronome became intensified to a considerable degree, but when ferrofucin was administered, CR intensification was only slightly increased. Apparently, after blood losses cerebral cortex activity disturbances are not so much connected with hypoxemia as with pathologic interoception caused by a sharp increase in the tonus of the arteriolae. Infusion of physiologic solutions, especially of ferrofucin restores the total blood volume and arrests spasms of the arteriolae, thus protecting the cortex from being flooded with pathologic impulses. -- S.M. Steynberg.

TITLE: species composition of Salmonella isolated during a five year period

SOURCE: Zhurnal mikrobiologii, epidemiologii i immunobiologii, no. 9, 1965, 139-140

TOPIC TAGS: microbiology, intestinal disease, disease control, food sanitation

ABSTRACT: During the five year period between 1958 and 1962, 31,403 persons were examined, among whom 122 (0.38%) were found to be salmonella-carriers. The greatest number of carriers was found among workers of food establishments, especially restaurants (0.6%). Of the total number of elicited carriers 36.6% were food-industry workers and persons comparable to them. The authors elicited 22 species of salmonella from groups A, B, C, D, and E. The most common was group B (53.3%), followed by

Card 1/2

L 10966-66

ACC NR: AP5028402

E(30%), D (9%), C(6.8%), and group A (0.9%). The authors establish the significant role in the etiology of disease played by *S. anatum* of the E group and the rarely encountered species *bovismorbificans*, *essen*, and *newlands*. The authors were able to ascertain the outcome of the infection in 79 persons: 28 had a clinically expressed disease, 29 were bacteria-carriers, and 22 were transient carriers of salmonella. The timely detection of salmonella-carriers by conducting planned examinations of food-industry workers and the realization of preventive measures prevented food poisoning and focal diseases.

TITLE: Microplasma phenomena in silicon

SOURCE: Fizika tverdogo tela, v. 3, no. 12, 1966, 3474-3479

TOPIC TAGS: silicon, semiconductor plasma, pn junction, surface property, volt
ampere characteristic, dielectric breakdown

ABSTRACT: This is a continuation of earlier work on deep lying p-n junctions (Radio-
tekhnika i elektronika v. 9, 56, 1966) and deals with microplasma phenomena occurring
in cascade breakdown of deep p-n junctions prepared by diffusion of boron in n-type
silicon. Most earlier investigations were limited to microplasmas produced at the
emergence of the p-n junction to the surface. The present investigation deals with
junctions that have a large depth (40 - 100 μ). Since the radiation from the micro-
plasma is practically absorbed by the silicon, the data on the microplasma deforma-
tion was obtained by studying the character of breakdown of a large number of cascade
microdiodes prepared on a single silicon plate by photolithography. Protection
against surface breakdown was afforded by a guard ring. The junctions were prepared
by a procedure described by the authors earlier (Elektrichestvo v. 7, 56, 1966). By
studying the oscillogram of the inverse volt-ampere characteristic of the diode

Card 1/2

ACC NR: AP/005d30

during the breakdown it was possible to determine the distribution of the microplasmas over the area of the junction, the volt-ampere characteristic, the variation of the microplasma temperature with current, and the geometric dimensions of the microplasma. The results show that the microplasmas are distributed quite uniformly over the area of the junction. Their number can be quite large, and the breakdown voltage can differ greatly from junction to junction. The breakdown volt-ampere characteristic can be approximated by an exponential function. The calculated geometrical dimensions of the microplasma were found to agree well with the experimental data. Orig. art. has: 4 figures, 8 formulas, and 1 table.

PERIODICAL: Zhurnal Obshchey Khimii, 1957, vol 27, No 2, pp. 330-333 (U.S.S.R.)

ABSTRACT: Investigation was conducted to determine the alkylation of 2- and 4-bromo phenols with pseudobutylene and cyclohexene in the presence of two boron fluoride catalysts. It is shown that the alkylation of 2-bromophenol with pseudobutylene leads to the formation of phenol products or mixture of ether and phenol products. In all other cases the authors obtained only ester type compounds. The alkylation products derived are identified as: secondary-butyl-2-bromophenol, secondary-butyl ether of 2-bromophenol, secondary-butyl ether of secondary-butyl-2-bromophenol, cyclohexyl ester of 2-bromophenol, secondary-butyl ether of 4-bromophenol, secondary butyl ether, 2-secondary-butyl-4-bromophenol and cyclohexyl ester of 4-bromophenol. The effect of the molar ratios of reagents and catalysts, and

Alkylation of 4-Bromophenol With Propylene and β -Amylene in the Presence of the Catalysts $\text{BF}_3 \cdot \text{HPO}_4$ and $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$
 [Alkilirovaniye 4-bromfenola propilenom i β -amilenom v prisutstvi katalizatorov $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ i $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$]

PERIODICAL:

Zhurnal obshchey khimii, 1959, Vol 29, Nr 4, pp 1340 - 1343 (USSR)

ABSTRACT:

This is a continuation of earlier investigations (Refs 1-5). In the present paper the authors investigated the alkylation of 4-bromophenol with propylene in the presence of $\text{BF}_3 \cdot \text{HPO}_4$ and with β -amylene in the presence of $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$ and $\text{BF}_3 \cdot \text{HPO}_4$ in carbon tetrachloride without solvents. It was found that 4-bromophenol yields with propylene and β -amylene in the presence of $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ and $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$ only ether products. Two compounds, the isopropyl ether of 4-bromophenol (I) and the isopropyl ether of isopropyl-4-bromophenol (II) are obtained with propylene. A secondary amyl ether of 4-bromophenol (III) was obtained with

SOV/79-29-4-64/77

β -amylenes. The molar conditions of the reacting compounds and the catalyst 2:1:0.2 are for the alkylation of 4-bromophenol with propylene in the presence of BF_3 , H_3PO_4 the best at 30° and in the case of slow addition of propylene (yields of (I) and (II), 48 and 14% respectively). These products resulted in the same total yield (62%) in the molar ratio 1:2:0.15 of 4-bromophenol, propylene, and catalyst. In this case, however, considerable quantities of resin are produced and the yields in (I) and (II) amount to 37 and 25% respectively. The temperature rise up to 50° increases the resin formation and reduces considerably the yield in alkylation products. The application of CCl_4 as solvent reduces the resin formation as well as the yield in (I) and (II). Further data are given in table 1. The alkylation of 4-bromophenol with β -amylenes in the presence of BF_3 , HPO_4 in a carbon tetrachloride solution is at room temperature accompanied by a polymerization. The yield in ether (III) is here not higher than 40%. In the presence of $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$ in the same

Card 2/3

TITLE:

Alkylation of 2- and 4-Anisole Chloride With Pentene-1 in the Presence of $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ as Catalyst

PERIODICAL:

Zhurnal obshchey khimii, 1960, Vol. 30, No. 12, pp. 3869-3871

TEXT: For several years the authors have studied the alkylation of phenol halides and anisole halides with olefins in the presence of boron fluoride catalysts. Alkylation is a very convenient method of synthesizing interesting alkyl halide phenols which have hitherto been hardly accessible in laboratory. This is a continuation of previous studies describing the results of alkylating 2- and 4-anisole chloride with pentene-1 in the presence of $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ as catalyst. In contrast to the reaction of 4-anisole chloride with propylene, pseudobutylene, cyclohexene and 4-anisole bromide with propylene, and cyclohexene (Ref. 1), only mono-sec.-amyl anisole chlorides are obtained. 2-anisole chloride alkylates with pentene-1 1.5 times more readily than 4-anisole chloride under similar conditions. The molar ratios 3:1:0.1 between 2-phenol chloride, pentene and the catalyst, Card 1/2

Alkylation of 2- and 4-Anisole Chloride With

B001/B064

and a temperature of 40°C proved to be the optimum conditions under which the 4-sec.-amyl-2-anisole chloride yield was 86%. To synthesize 2-sec.-amyl-4-anisole chloride in a 54% yield, the molar ratio of the reagents and the catalyst must be 4:1:0.2, and the temperature 40°C . A temperature between 20 and 60°C has no essential effect upon the yield in alkylation products. The ratios of the reagents of 4:1 to 2:1, and the amounts of catalyst between 0.1 - 0.3 per 1 mole pentene-1 bear also no influence upon the yields. The best results are obtained when the calculated amount of anisole chloride is at once added to the catalyst and when pentene-1 is slowly added to this mixture. When pentene-1 is mixed with a part of anisole chloride, the yield in alkylation products is lower. There are 2 tables and 3 Soviet references.

AUTHORS: Kryuchkova, V. G. and Zavgorodniy, S. V.
TITLE: Demethylation of Alkyl Halide Anisoles
PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 12,
pp. 3872-3873

TEXT: The authors demethylated several alkyl halide anisoles hitherto little investigated. This paper does not discuss the rate of demethylation and the finding of the best reaction conditions, but the synthesis of alkyl halide phenols. Nevertheless, the results obtained lead to interesting conclusions on the behavior of the anisole group toward hydriodic acid and hydrobromic acid. It was found that all monoalkyl substituted o- and p-fluoro anisoles and o- and p-chloro anisoles can be demethylated into the corresponding alkyl halide phenols when heated with HI or HBr for a longer time; this demethylation, is, however, not quantitative. 4-alkyl-2-anisole halides demethylate more readily. Among the 14 alkyl halide anisoles, 4-sec.-amyl-2-fluoro anisole demethylate most readily to 4-sec.-amyl-2-fluoro phenol (88% yield) (Table), 2,6-dialkyl-4-anisole halides do not demethylate with

Card 1/2

HI and HBr under ordinary conditions; the reason is the blocking of the methoxy group by the two alkyl radicals which are in ortho position to it. At continuous heating of 2-cyclohexyl-4-chloro anisole with HI, besides demethylation also a splitting off of the chlorine atom takes place, which instead of the expected 2-cyclohexyl-4-chloro phenol leads to 2-cyclohexyl phenol. There are 1 table and 3 references: 2 Soviet and 1 British.

TITLE:

Alkylation of 4-Fluorophenol¹ With Propylene¹ and Cyclohexene¹ in the
Presence of the Catalysts $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ and $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$

PERIODICAL:

Doklady Akademii nauk SSSR, 1960, Vol 131, Nr 2, pp 329-331 (USSR)

ABSTRACT:

As the reaction of fluorophenols with olefins had been neglected in publications, the authors studied the reaction mentioned in the title in continuation of their previous papers. 4-fluorophenol reacts more intensely than chloro- and bromophenols. Together with olefins (with propylene) it forms a rather complex mixture of products. Isopropylfluorophenolisopropyl ether is always, isopropylfluorophenol sometimes, formed besides the 4-fluorophenolisopropyl ether. The yields in individual products depend on the nature and quantity of the catalyst, the temperature, and the molar ratios of the reagents. Thus, only ethers are formed in the presence of $\text{BF}_3 \cdot \text{O}(\text{C}_2\text{H}_5)_2$ at 60° whereas phenol products are missing, at least in noticeable quantities. In the presence of $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$, the yields in phenol compounds are the higher, the higher the temperature between 40 and 70°. The best conditions for a formation of 4-fluorophenolisopropyl ether (54% yield) are: molar ratio of fluorophenol,

propylene and $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ = 3:1:0.4 and 40°; the same for isopropyl-4-fluorophenolisopropyl ether is: 5:1:0.3 and 60° (36% yield), and for isopropyl-4-fluorophenol 3:1:0.2 and 70° (38% yield). Table 1 lists these results. One product only - 4-fluorophenolcyclohexyl ether - is formed from 4-fluorophenol with cyclohexane in the presence of $\text{BF}_3 \cdot \text{H}_3\text{PO}_4$ with a yield of 70.7% of the theoretical one. Already after the 1st distillation of the alkylate, the product has a boiling limit of 2-3° (Table 2). The compounds of the ether type were identified by splitting into corresponding phenols and transformation of the phenols into phenoxy acetic acids. Table 3 shows the physical and chemical constants of the products obtained. There are 3 tables and 8 references, 6 of which are Soviet.
